HDMI™ Changeover Switch

2 IN > 1 OUT, automatic

This SCHWAIGER® HDMI™ changeover switch is used to operate two digital playback devices (audio and video) with one HDMI compatible playback device. For example, two devices such as a DVD player and a set top box can be connected to a single TV. The

changeover switch operates automatically and the selected channels are displayed on the switch by LEDs. With this switch, there is no need for a separate power supply. As there also is no need for installation of any software, it is ready for immediate use.
