

TIBO WiFi Loudspeaker (40 W)

for integration into the Home Automation network

This TIBO active loudspeaker can communicate with the gateway via the home network. Integrated in the Home Automation (HA) network, all audio streams can be played back. In addition, the loudspeaker functions as an Internet radio, playback medium for text

messages or as an alarm indicator. If the device is integrated in the HA network, scenes can also be created at any time with other components of the Home Automation series.
